

Requirements;

- Java 8

Steps to install the Galactic Drive server;

- 1) Run the *startserver.bat* file located in the directory you found this README.
- 2) After the script has downloaded all mods, it will ask you to type TRUE to accept the Minecraft EULA.
- 3) The server will crash at this point. Either Spam CTRL+C or follow the terminal prompts to close the server. Drag the “mods” folder located in the same directory as this README, into the “GalacticDriveServer” directory, merging the two mods folders.
- 4) You can then fully start the server, which has been installed in the *GalacticDriveServer* directory the directory you found this README.
- 5) You can stop the server with the *stop* command. To run the server again, run the *startserver.bat* file again. It will not initiate the server download if it has already been done, and will instead skip straight to starting the server.

Things to note;

- If you are contributing to the modpack, ENSURE you discard all server related commits.
- You can modify the maximum memory allocated to the server at **Line 134** within the *server-setup-config.yaml* file.
- The *generator-settings* entry within the *server.properties* file must ALWAYS be the following;

```
generator-settings={"Topography-Preset":"Galactic Drive"}
```

This file is provided with this entry set by default. Do not change it!

- After you have installed the server with the *startserver.bat* file, you can delete all the files in the root directory except the *GalacticDriveServer* directory , and use a custom server start script if you choose.
